

1. Ideation Phase

Project Module: Laptop Request Process

Description: Built a ServiceNow system using Flow Designer to completely automate laptop requests, approvals, and IT setup tasks.

This document serves as the formal milestone artifact for the ServiceNow development workflow lifecycle.

Problem Statement

Manual laptop request processes are slow and inefficient because they rely completely on **disorganized emails and spreadsheets**. This lack of a central tool makes it incredibly difficult for managers to **track the status of an asset** or see where a request is stuck. As a direct result, IT support teams face massive delays, leading to frustrated employees **waiting days to receive working equipment**.

Proposed Solution

The proposed system uses a centralized **ServiceNow Service Catalog item** to completely automate the entire request pipeline. Built natively with **Flow Designer**, it instantly routes approval notifications to managers the moment a form is submitted online. Once approved, the system automatically **creates organized fulfillment tasks** for the IT team, eliminating manual paperwork and tracking everything in real-time.

Target Audience & Value Proposition

Employees & Managers: A simple portal to request laptops and a one-click way for managers to approve
IT Technicians: Automated setup tasks showing exactly what laptop to prepare and deploy.
