

3. Project Design Phase

Project Module: Laptop Request Process

Phase Description: UI/UX mapping, Flow Designer logical schema routing blueprints, and data setup.

This document serves as the formal milestone artifact for the ServiceNow development workflow lifecycle.

Service Portal Design

- **Created Scoped Boundary:** Set up a clean, isolated custom application scope called **FlowDesk** to keep all form configurations separate from global platform files.
- **Built Front-End Interface:** Developed a custom **Service Catalog Item** layout containing three distinct variable fields (*requested_for*, *laptop_type*, *business_justification*).
- **Configured Layout Constraints:** Positioned the fields sequentially using standard ordering rules (100, 200, 300) to guarantee a structured user-portal interface.

Flow Designer Logic

- **Engineered 8-Step Core Logic:** Built a complete, automated background workflow engine inside **Flow Designer** triggered instantly upon user form submission.

START -> [1. Find Manager]-> [2. Ask Approval]-> [If Approved: 3. Update State -> 4. Create IT Task-> 5. Wait for Delivery-> 6. Send Success Email] OR [If Rejected: 7. Cancel Request → 8. Send Rejection Email] → [End]

- **Built Dynamic Lookups:** Configured a data lookup action to automatically pull the requester's specific manager profile from the live user table database.
- **Programmed Gate Condition:** Designed a branching decision matrix that halts the flow, routes a live approval token to the manager, and forks into two distinct paths: **Approved** or **Rejected**.

Data Dictionary & Data Pill Mapping Schema

- **Mapped Zero-Script Data Pipelines:** Configured **Data Pills** to pass variables seamlessly across records without using old client scripts or UI actions.
- **Automated IT Ticket Routing:** Programmed an automatic action to pass the selected laptop model variable data straight into a newly generated **Catalog Task (sc_task)** assigned to the IT fulfillment team.
- **Configured Flow Email Actions:** Used Flow Designer's native **"Send Email"** action to create and preview quick email templates that pull data pills dynamically for status updates.

Visual Implementation Evidence (Screenshots)

1. Trigger created

The screenshot shows the Workflow Studio interface for a flow named 'Laptop Request Process Flow'. The flow is currently 'Active'. The trigger is 'Service Catalog'. The right-hand pane shows the 'Data' section, which is collapsed. The flow is viewed in 'Diagram' mode.

2. 8-steps of Action

The screenshot shows the 'ACTIONS' section of the 'Laptop Request Process Flow'. The flow consists of 8 steps:

1. Get Catalog Variables from Laptop Request
2. Ask For Approval on Requested Item
3. If If Approved (Decision)
4. then Update Requested Item Record
5. Send Email
6. Create Catalog Task
7. Update Requested Item Record
8. Send Email

The right-hand pane shows the 'Data' section, which is expanded. It displays the data structure for the flow, including variables like 'laptop_type', 'requested_for', 'business_justification', and 'Approval State'.
